Tired of constantly seeing breakouts on your face?

With pulsed light acne treatment, you can get closer to the **clearer skin** you've always wanted. This treatment provides lasting and effective results. The secret lies in the technology that concentrates the light into specific wavelengths that target acne-causing bacteria.

How does it work?

The MaxV handpiece filters light in the ideal band of the spectrum to target the sebaceous glands and destroy bacteria responsible for acne without harming the surrounding skin.

What results can I expect?

Expect to see an improvement in the appearance of acne and blemishes on the treated areas. A few treatments may be necessary for desired results. Possible side effects include a mild sunburn-like sensation and minor swelling lasting just a few hours. Blemishes usually fade 2-3 weeks post-treatment, revealing clearer skin.

Schedule your treatment session today.

*Individual results may vary and are not guaranteed.

** Laser consultation fee waived with the purchase of a treatment.
