Feel and look refreshed in just a few treatments.

With laser skin resurfacing, you can easily improve many undesirable skin imperfections. By targeting **sun damage, pigmentation, brown spots** and **wrinkles**, this technology improves skin texture, tone, and color irregularities, leaving an improved, smoother complexion.

How does it work?

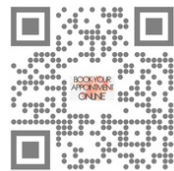

Microbeam pulses of nonablative fractionated laser energy (1540 nm) are delivered deep into the skin, harnessing your body's natural repair system to stimulate collagen and elastin production, promoting skin remodeling. This natural repair process leads to increased skin volume.

What results can I expect?

You can expect to see an improvement in the appearance of sun damage, pigmentation, fine lines and wrinkles. Skin volume will increase resulting in a smoother, more even skin tone*. A series of treatments may be required for desired results.

Treatment plans can be adjusted to fit your lifestyle.

Schedule your treatment session today.

*Individual results may vary and are not guaranteed.

** Laser consultation fee waived with the purchase of a treatment.
